

Vomit, Blood & Faecal Accident Response Plan

(Concourse, bathroom floors and pool surfaces)

- 1. Request people to leave the immediate area**, where the accident occurred and prevent access to the area.
- 2. Remove as much of the solid material (e.g. vomit)** as possible using disposable gloves and dispose of the waste into a toilet. Disinfect or dispose of all equipment used to collect the waste.
- 3. The remaining material should be treated with a hospital grade disinfectant** (for at least 10 mins) following safe work practices and the area should be thoroughly flushed with clean water to the nearest floor drain. *(If the concourse slopes to the pool, spot cleaning is required to prevent wastewater entering the pool)*
