

## NSW Arbovirus Surveillance and Mosquito Monitoring 2023-2024

Environmental Health Branch, Health Protection NSW

Weekly Update: Week ending 17 February 2024

Bottom left - Common banded mosquito, Culex annulirostris Top and bottom right - Saltmarsh mosquito, Aedes vigilax (Copyright 2020)

Weekly reports are available on Mosquito-borne disease surveillance.

### Please send questions or comments about this report to:

Surveillance and Risk Unit, Environmental Health Branch, Health Protection NSW: hssgehbsurveillance@health.nsw.gov.au

Testing and scientific services are provided by the Department of Medical Entomology, NSW Health Pathology, Institute of Clinical Pathology and Medical Research (ICPMR) for mosquito surveillance, and the Arbovirus Emerging Diseases Unit, NSW Health Pathology (ICPMR) for sentinel chicken surveillance.

The arbovirus surveillance and mosquito monitoring results in this report remain the property of the NSW Ministry of Health and may not be used or disseminated to unauthorised persons or organisations without permission.

SPHN (EH) 230938

### Summary

### **Arbovirus detections**

### Sentinel chickens

• There were no arbovirus detections in sentinel chickens for the week ending 17 February 2024.

### **Mosquito isolates**

• In the week ending 17 February 2024, Ross River virus was detected in mosquito samples from Byron Bay and Ballina; Edge Hill virus was detected in mosquito samples from Lake Cathie and Newcastle; and Stratford virus was detected in mosquito samples from Newcastle and Bankstown.

### Mosquito abundance

### Inland

- Low: Albury, Balranald, Goulburn, Leeton, Macquarie Marshes, Menindee, Moree, Murrumbidgee, Wagga Wagga.
- Medium: Grong Grong, West Wyalong.
- High: Forbes, Griffith, Wilcannia, Yass.

### Coastal

- Low: Batemans Bay, Lismore, Murwillumbah, Wauchope, Wyong.
- Medium: Gosford, Kempsey.
- **High:** Ballina, Byron Bay, Lake Cathie, Narooma, Port Macquarie, Tweed Heads.
- Very High: Nambucca, Newcastle.

#### Sydney

- Low: Blacktown, Georges River, Hills Shire.
- Medium: Northern Beaches, Penrith.
- **High:** Bankstown, Canada Bay, Hawkesbury, Liverpool, Parramatta, Sydney Olympic Park.

### **Environmental conditions**

#### Climate

- In the week ending 17 February 2024, rainfall was average, or lower than average across NSW, except for Mid North Coast and Northern NSW, where rainfall was higher than average.
- In January, rainfall was slightly above average across most parts of NSW with the Northern NSW region experiencing higher than average levels of rainfall.
- In the coming week, 23 February to 29 February 2024, higher than average rainfall is expected across NSW, particularly in the Murrumbidgee and Far West regions of NSW.
- Minimum and maximum temperatures in NSW are expected to be higher than average across NSW in the coming week. Maximum temperatures are expected to be higher than average particularly along the coast, in Hunter New England and in the northern part of Western NSW.

### Tides

• High tides over 1.8 metres are predicted for 8-13 March 2024, 6-12 April 2024 and 7-12 May which could trigger hatching of *Aedes vigilax*.

### Human arboviral disease notifications

#### **Ross River virus**

Three probable cases were notified in the week ending 17 February 2024.

### **Barmah Forest virus**

Three probable cases were notified in the week ending 17 February 2024.

### **Arbovirus detections**

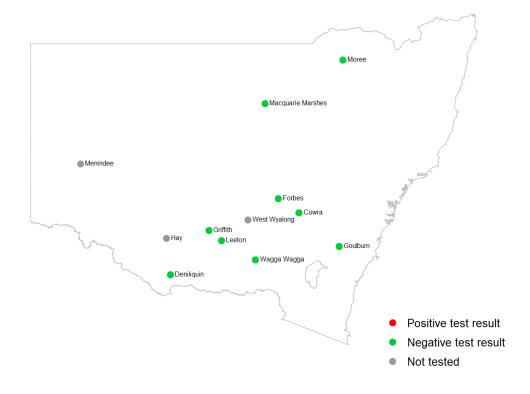

This section details detections of Murray Valley encephalitis virus, Japanese encephalitis virus, Kunjin virus, Ross River virus and Barmah Forest virus in the NSW Arbovirus Surveillance and Mosquito Monitoring Program.

### **Sentinel chickens**

Chickens are bled for detection of antibodies directed against Murray Valley encephalitis virus, Japanese encephalitis virus and Kunjin virus, indicating exposure to these viruses. Test results for the past week are shown in the map below. A positive test result indicates one or more chickens in a flock tested positive for the **first time** to antibodies directed against a particular virus, indicating newly acquired infection.

### Sentinel chicken antibody test results for samples collected in the week ending 17 February 2024

There were no arbovirus detections in sentinel chickens for the week ending 17 February 2024.

Positive test results in the 2023-2024 surveillance season.

Date of sample collection	Location	Virus
2023-12-17	*Menindee	Japanese Encephalitis

\*The sentinel chicken had only recently arrived in Menindee and is likely to have acquired Japanese encephalitis virus in Cowra prior to arrival in Menindee.

### **Mosquito isolates**

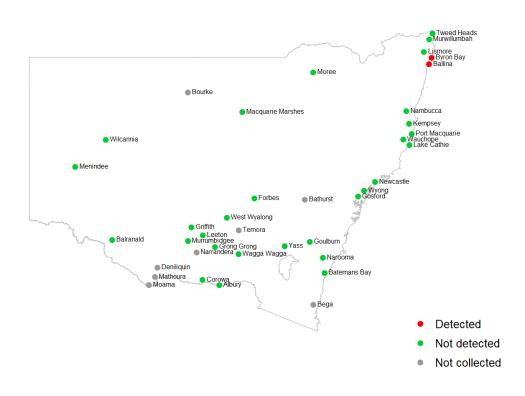

Whole grinds of collected mosquitoes are tested for arbovirus nucleic acids to determine the presence of arboviruses in mosquitoes. Test results for detections of Murray Valley encephalitis virus, Japanese encephalitis virus, Kunjin virus, Ross River virus and Barmah Forest virus for the past week are shown in the maps below. Detections of all arboviruses (including Edge Hill virus and Kokobera virus) for the season are detailed in the positive test results for the 2023-2024 surveillance season.

### Test results for mosquito trapping sites reported in the week ending 17 February 2024

In the week ending 17 February 2024, Ross River virus was detected in mosquito samples from Byron Bay and Ballina; Edge Hill virus was detected in mosquito samples from Lake Cathie and Newcastle; and Stratford virus was detected in mosquito samples from Newcastle and Bankstown.

### Inland and coastal sites

The map highlights detections of arboviruses that can cause human notifiable conditions, such as Murray Valley encephalitis virus, Japanese encephalitis virus, Kunjin virus, Ross River virus, and Barmah Forest virus. Detections of all arboviruses (including Edge Hill virus, Stratford virus and Kokobera virus) for the season are detailed in the positive test results for the 2023-2024 surveillance season.

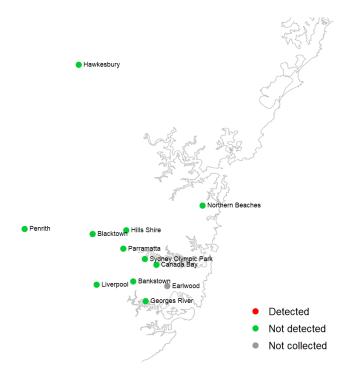

Inland and coastal sites - positive test results in the 2023-2024 surveillance season.

Date of sample collection	Location	Virus
2024-01-03	Gosford	Edge Hill
2024-01-16	Gosford	Edge Hill
2024-01-22	Macquarie Marshes	Kokobera
2024-01-23	Newcastle	Edge Hill
2024-01-29	Tweed	Edge Hill
2024-01-29	Tweed	Ross River
2024-01-29	Temora	Kokobera
2024-01-29	Narrandera	Kokobera
2024-01-30	Forbes	Kokobera
2024-02-04	Narooma	Stratford
2024-02-05	Byron Bay	Ross River
2024-02-06	Batemans Bay	Edge Hill
2024-02-06	Newcastle	Barmah Forest
2024-02-06	Newcastle	Edge Hill
2024-02-06	Newcastle	Stratford
2024-02-07	Central Coast	Edge Hill
2024-02-07	Central Coast	Stratford
2024-02-12	Byron Bay	Ross River
2024-02-12	Ballina	Ross River
2024-02-12	Lake Cathie	Edge Hill
2024-02-12	Newcastle	Edge Hill
2024-02-12	Newcastle	Stratford

**Please note:** Human cases of Edge Hill virus, Stratford virus or Kokobera virus have rarely been reported. Infection may present as a mild self-limiting febrile illness with body aches.

#### Sydney sites

The map highlights detections of arboviruses that can cause human notifiable conditions, such as Murray Valley encephalitis virus, Japanese encephalitis virus, Kunjin virus, Ross River virus, and Barmah Forest virus. Detections of all arboviruses (including Edge Hill virus, Stratford virus and Kokobera virus) for the season are detailed in the positive test results for the 2023-2024 surveillance season.

Sydney - positive test results in the 2023-2024 surveillance season.

Date of sample collection	Location	Virus
2024-01-29	Sydney Olympic Park	Edge Hill
2024-01-29	Northern Beaches	Edge Hill
2024-01-30	Bankstown	Edge Hill
2024-01-30	Georges River	Edge Hill
2024-02-05	Sydney Olympic Park	Edge Hill
2024-02-05	Sydney Olympic Park	Stratford
2024-02-06	Parramatta	Edge Hill
2024-02-06	Hawkesbury	Stratford
2024-02-07	Georges River	Edge Hill
2024-02-07	Georges River	Stratford
2024-02-12	Bankstown	Stratford

### Mosquito abundance

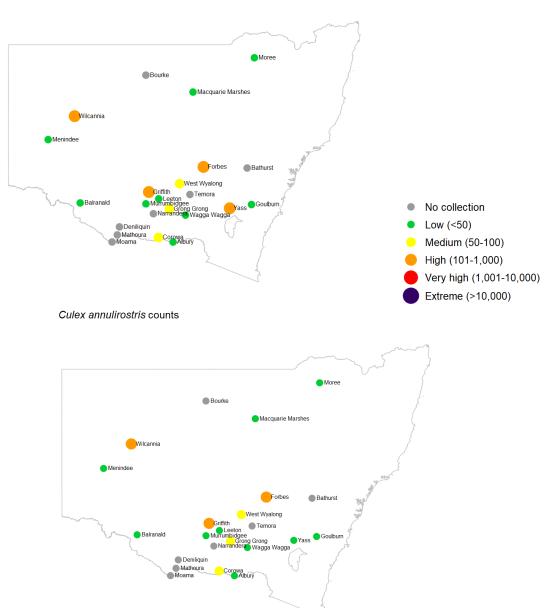

This section details counts of mosquitoes in the NSW Arbovirus Surveillance and Mosquito Monitoring Program. Each location represents the count average for all trapping sites at that location for the most recent week that collections were provided prior to preparation of this report.

*Culex annulirostris* and *Aedes vigilax* are vectors of interest for Ross River virus and Barmah Forest virus, *Culex annulirostris* is also a vector for Japanese encephalitis virus.

### **Mosquito counts**

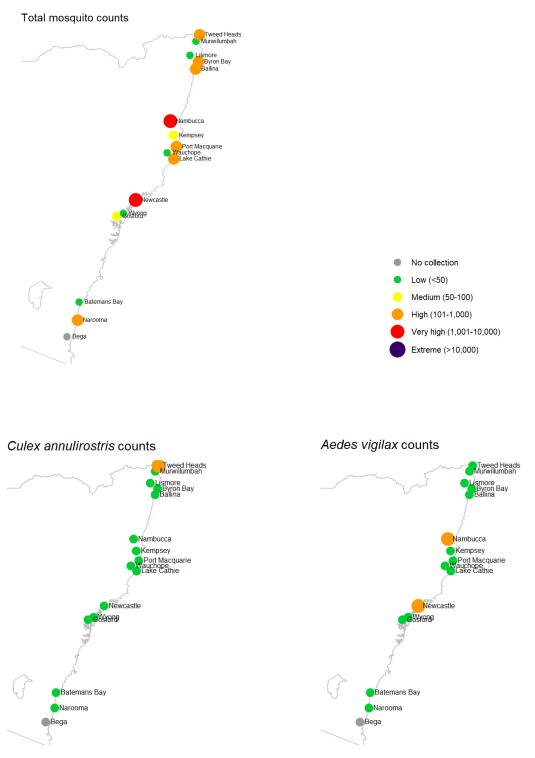

Mosquito counts (average per trap per location) for mosquito trapping sites reported in the week ending 17 February 2024

### **Inland sites**

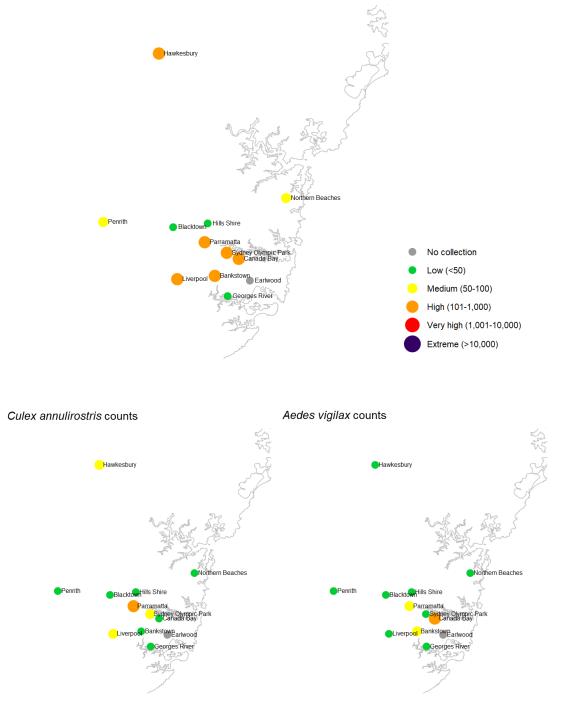

Total mosquito counts

### **Coastal sites**

### Sydney sites

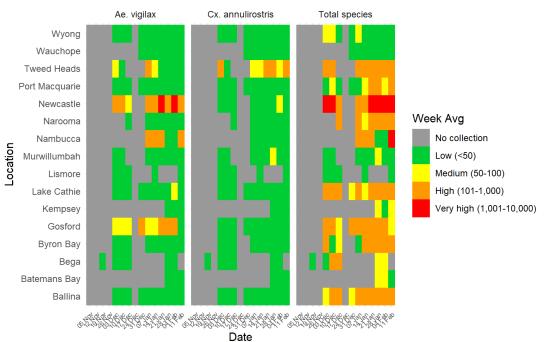

Total mosquito counts

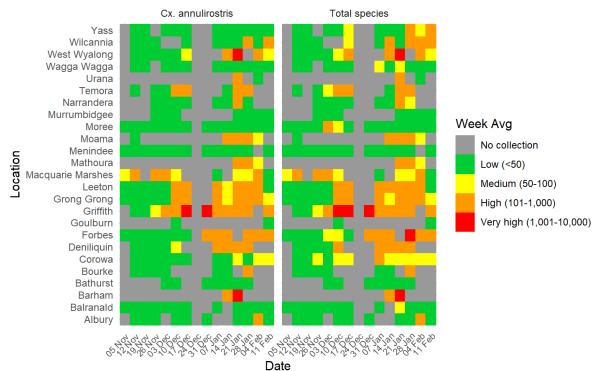

# Mosquito abundance results for the 2023-2024 season

This section shows all mosquito trapping results by location and species type to date for the current arbovirus season.

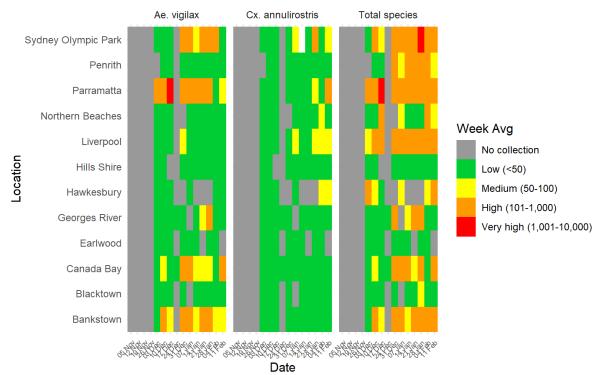

### Cumulative mosquito abundance tables

### Number of mosquitoes trapped inland (weekly average)

### Number of mosquitoes trapped in Sydney (weekly average)

### **Environmental conditions**

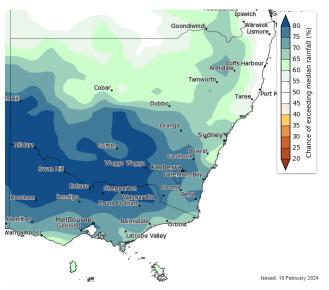

Mosquitoes require water to breed. Rainfall and tides (for the salt marsh mosquito, *Aedes vigilax*) are important contributing factors for proliferation of mosquito numbers. Unseasonably warm weather can also contribute to higher mosquito numbers.

### Rainfall

In the week ending 17 February 2024, rainfall was average, or lower than average across NSW, except for the Mid North Coast and Northern NSW where rainfall was higher than average. In January, rainfall was slightly above average across most parts of NSW with the Northern NSW region experiencing particularly high levels of rainfall.

### Upcoming week's rainfall and temperature outlook

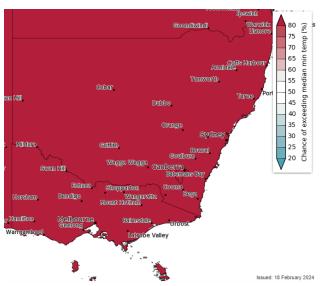

Higher than average rainfall is expected across NSW in the coming week, particularly in the Murrumbidgee and Far West regions of NSW.

### Rainfall 13 February to 29 February, 2024

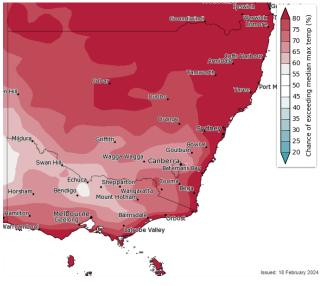

### Minimum temperature 23 February to 29 February, 2024

In the upcoming week, minimum temperatures are expected to be higher than average across NSW.

### Maximum temperature 23 February to 29 February, 2024

In the upcoming week, maximum temperatures are forecast to be higher than average across NSW, particularly along the coast, in Hunter New England and in the northern part of Western NSW.

### Tides

Tidal information is relevant for the prediction of the activity of the salt marsh mosquito, *Aedes vigilax*. Typically for NSW, high tides of over 1.8 m, as measured at Sydney, can induce hatching of *Aedes vigilax* larvae. Predicted tide heights can provide some indication of when this is likely to occur.

### Dates of predicted high tides of over 1.8 m at Sydney (Fort Denison)

- 8-13 March 2024
- 6-12 April 2024
- 7-12 May

Source: Australian Government, Bureau of Meteorology. Note: Measured tides at Sydney Port Jackson for the current week are available from the NSW Government, Manly Hydraulics Laboratory.

### Human arboviral disease notifications

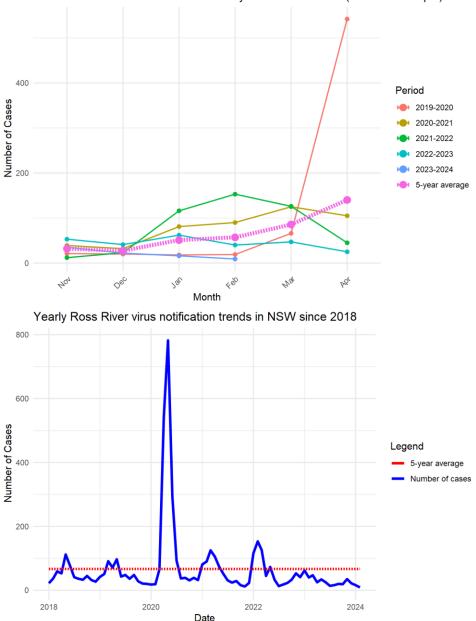

Under the NSW Public Health Act 2010, human arboviral infections are notifiable in NSW.

Recent notifications of Ross River virus and Barmah Forest virus infections in humans (by date of case report received)

Notifications of Ross River virus and Barmah Forest virus infections, by month of disease onset (the earlier of patient-reported onset or specimen collection date), are available online at the NSW Health website - infectious diseases data.

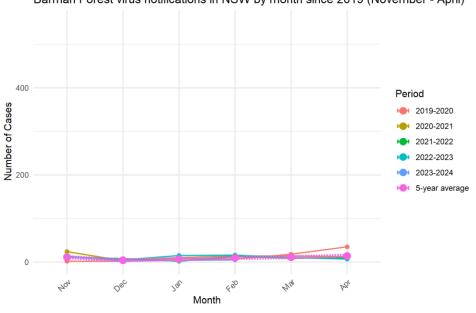

The following figures show notifications for the current NSW Arbovirus Surveillance and Mosquito Monitoring season (2023-2024), and the same period in the previous four years.

### **Ross River virus**

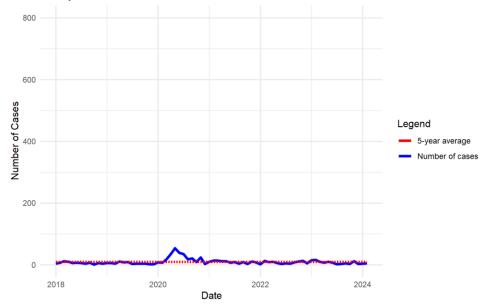

Ross River virus notifications in NSW by month since 2019 (November - April)

### **Barmah Forest virus**

Barmah Forest virus notifications in NSW by month since 2019 (November - April)

Note: Presented human cases include both confirmed and probable cases.
