

NSW Health Influenza Surveillance Report

Week 42: 17 to 23 October 2016

Summary:

- **Seasonal influenza activity continues to fall across most NSW local health districts, with all indicators indicating a return to inter-seasonal activity.**
- **Influenza A(H3N2) remains the dominant circulating influenza strain.**

In this reporting week:

- [Hospital Surveillance](#) – influenza like illness (ILI) presentations to selected emergency departments decreased this week and remained at inter-seasonal levels. The index of increase indicates that seasonal activity peaked on 28 August and fell below the seasonal threshold on 27 September.
- [Laboratory surveillance](#) – the total number of influenza isolations decreased further this week with the proportion of respiratory samples positive for influenza at 8.9%.
- [Community surveillance](#) – influenza notifications increased slightly across a few NSW local health districts (LHD) this week but activity remains low. General practice and community-based surveillance systems showed decreasing ILI activity. Aged care facilities have been affected with four new respiratory outbreaks reported this week.
- [National and international influenza surveillance](#) – the most recent national report suggests influenza activity declined nationally; however, widespread activity continued to be reported in a number of regions. Current influenza strains are well-matched to the 2016 influenza vaccines.
- [Recommended composition of 2017 influenza vaccines](#) – the World Health Organization (WHO) has provided recommendations for the 2017 southern hemisphere winter influenza season including one strain change.

About this report:

Health Protection NSW collects and analyses surveillance data on influenza and other respiratory viruses. Surveillance reports are produced weekly commencing in May, and continuing until the end of the influenza season. Monthly reports are produced throughout the rest of the year.

The influenza surveillance reports include data from a range of surveillance systems and sources concerned with Emergency Department illness surveillance, laboratory (virological) surveillance, and community illness surveillance. Pneumonia and influenza mortality data are also monitored and reported upon periodically.

For further information on influenza see the [NSW Health Influenza website](#).

1. Hospital Surveillance

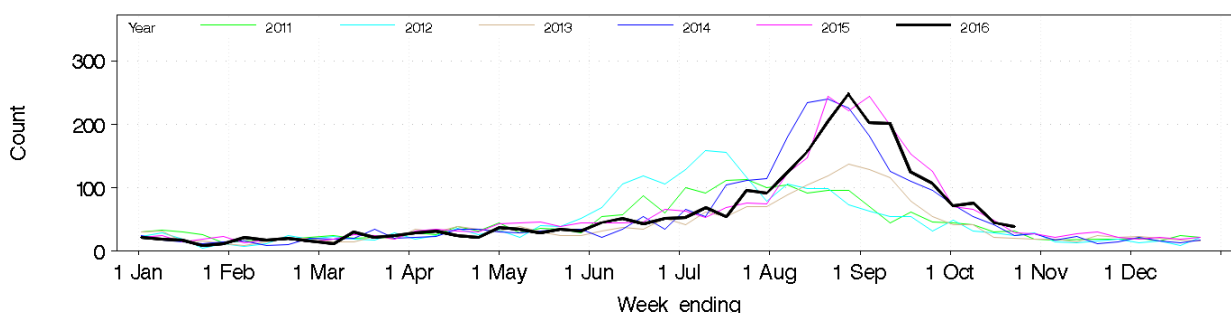

NSW emergency department (ED) presentations for influenza-like illness (ILI) and other respiratory illnesses

Source: PHREDSS [1]

For the week ending 23 October 2016:

- ILI presentations [2] decreased this week but were above the usual range for this time of year. ILI presentations were significantly above the five-year mean in Nepean Blue Mountains LHD and at Mount Druitt and Dubbo Base Hospitals (Figure 1 and Table 1).
- The index of increase for ILI presentations was 4.4 on 23 October, similar to the previous week (4.9). Based on the index threshold of 15, this year's influenza season commenced around 26 June 2016, peaked on Sunday 28 August 2016 at 61.0 (lower than the peak of 64.2 seen in 2015) and ended on 27 September 2016.
- The proportion of ILI presentations to all ED presentations was low at 0.9 per 1000 presentations, lower than the previous week (1.9).
- ED presentations for pneumonia [3] decreased but were above the usual range for this time of year. Presentations were significantly above the five-year mean in people aged 65 years and over (Figure 2 and Table 1.)
- ILI and pneumonia presentations which resulted in admission also decreased but remained above the usual range for this time of year. Admissions were significantly above the five-year mean at Campbelltown Hospital (Table 1).
- Pneumonia and ILI presentations which resulted in admission to critical care increased and were above the usual range for this time of year (Figure 3 and Table 1).
- Bronchiolitis presentations this week decreased and were within the usual range for this time of year (Table 1).
- Presentations in the category combining all respiratory, fever and unspecified infections were steady but were above the usual range for this time of year. Presentations were significantly above the five-year mean in people aged 65 years and over (Table 1).

Figure 1: Total weekly counts of ED visits for influenza-like illness, all ages, from 1 January – 23 October 2016 (black line), compared with each of the 5 previous years (coloured lines).

[1] NSW Health Public Health Rapid, Emergency Disease and Syndromic Surveillance system. Centre for Epidemiology and Evidence, NSW Ministry of Health. Comparisons are made with data for the preceding five years. Recent counts are subject to change. As of 31 March 2016, data from 60 NSW emergency departments are included representing approximately 82% of ED visits in the 2015-16 financial year. The coverage of rural EDs is lower than metropolitan EDs. Data shown represents unplanned presentations to hospital EDs.

[2] The ED 'ILI' syndrome includes provisional diagnoses selected by a clinician of 'influenza-like illness' or 'influenza' (including 'pneumonia with influenza'), avian and other new influenza viruses.

[3] The ED 'Pneumonia' syndrome includes provisional diagnoses selected by a clinician of 'viral, bacterial, atypical or unspecified pneumonia', 'SARS', or 'legionnaire's disease'. It excludes the diagnosis 'pneumonia with influenza'.

Figure 2: Total weekly counts of ED presentations for pneumonia that were admitted, all ages, from 1 January – 23 October 2016 (black line), compared with each of the 5 previous years (coloured lines).

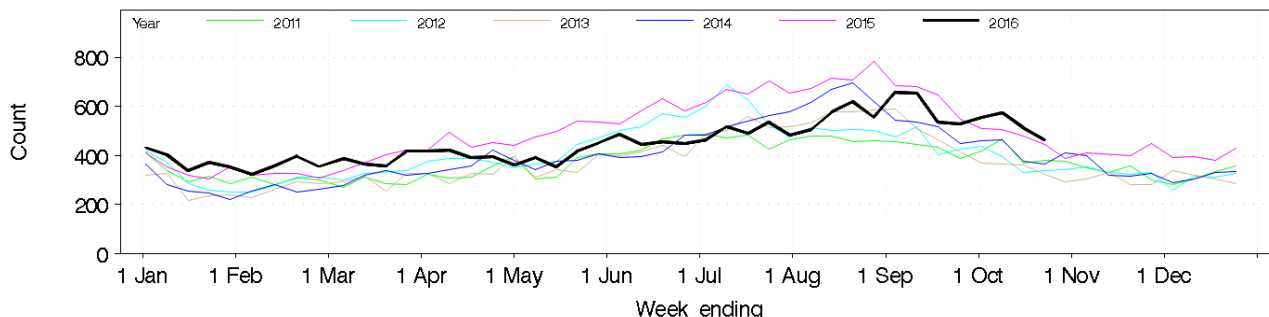

Figure 3 Total weekly counts of ED presentations for pneumonia or influenza-like illness and admitted to a critical care ward, all ages, from 1 January – 23 October 2016 (black line), compared with each of the 5 previous years (coloured lines).

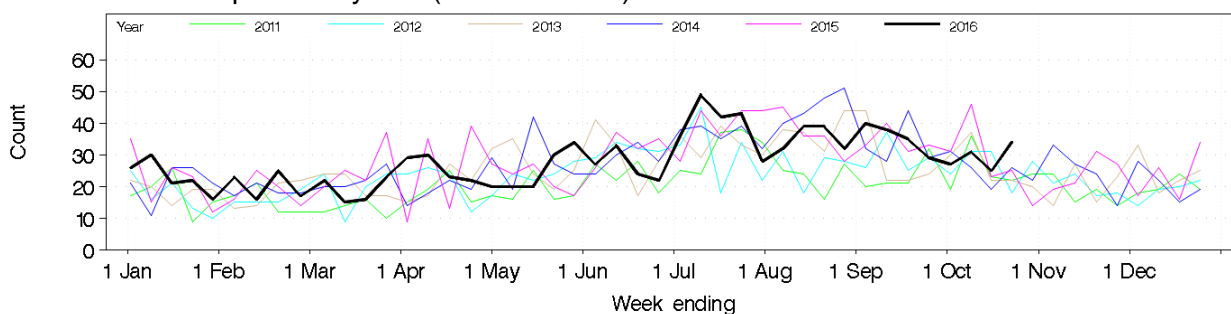

Table 1: Weekly ED and Ambulance Respiratory Activity Summary for the week ending 23 October 2016. Includes data from 60 NSW EDs and the NSW Ambulance Division [4].

Data source	Diagnosis or problem category	Trend since last week	Comparison with usual range for time of year*	Statistically significant age groups (if any)	Locations with weekly counts significantly above the 5 year mean	Severity indicators** with weekly counts significantly above the 5 year mean	Comment
ED presentations, 60 NSW hospitals	Influenza-like illness (ILI)	Decreased	Above		Nepean Blue mountains LHD Mount Druitt Hospital Dubbo Base Hospital		Daily index of increase = 4.4
	Pneumonia	Decreased	Above	65+ years			
	Pneumonia and ILI admissions	Decreased	Above		Campbelltown Hospital		
	Pneumonia and ILI critical care admissions	Increased	Above				
	Asthma	Increased	Usual		Gunnedah Hospital		
	Bronchiolitis	Decreased	Usual		Far West LHD Liverpool Hospital		Bronchiolitis is a disease of infants. Daily index of increase = 8.5
	Breathing problems	Increased	Above	65+ years			
	All respiratory illness, fever and unspecified infections	Steady	Above	65+ years			

[4] Notes for Table 1: *The usual range for the time of year is the range of weekly counts for the same week in the previous five years for ED presentations. Key: Non-bold and green =usual range; Non-bold and orange= above usual range, but not significantly; Bold and red = statistically greater than usual range. Counts are statistically significant if they are at least five standard deviations above the five-year mean for ED presentations; the ILI 'daily index of increase' is statistically significant above a threshold of 15. **Severity indicators include: Admission to a ward or critical care service; Triage category 1; Ambulance arrival and Death in ED.

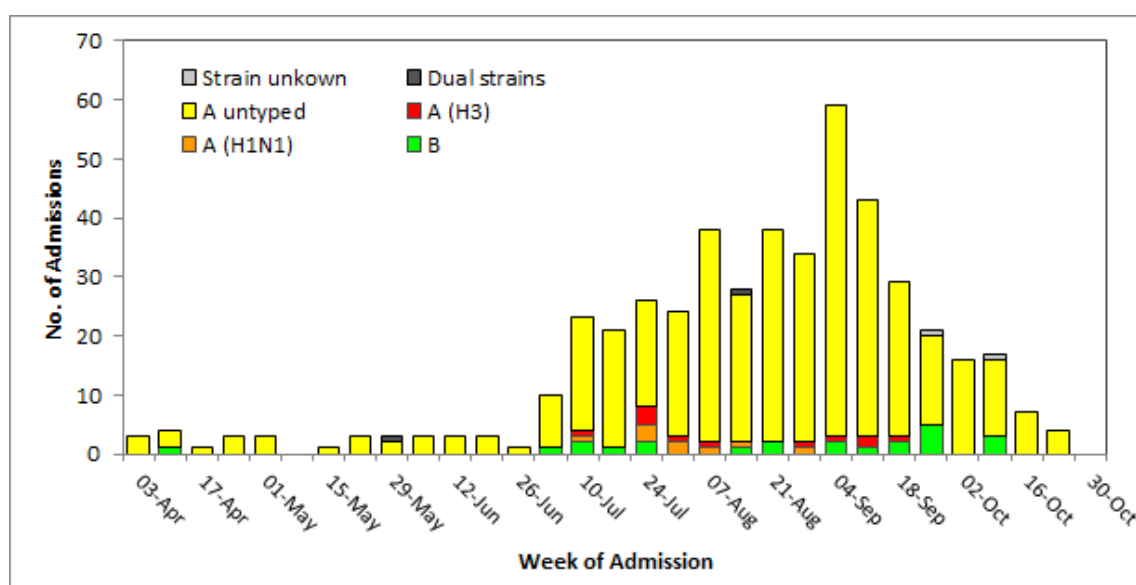

FluCAN (The Influenza Complications Alert Network)

In 2009, the [FluCAN](#) surveillance system was created to be a rapid alert system for severe respiratory illness requiring hospitalisation. Data is provided on patients admitted with influenza confirmed by polymerase chain reaction (PCR) testing.

In NSW, three hospitals participate in providing weekly FluCAN data: Westmead Hospital, John Hunter Hospital and the Children's Hospital at Westmead.

- During week 42 there were 4 influenza admissions (2 adults and 2 children) in NSW sentinel hospitals (Figure 5).
- Since 1 April 2016, there have been 467 hospital admissions reported for influenza; 440 with influenza A, 23 with influenza B, two with co-infections and two strains unknown (Figure 4).
- Of these admissions, 123 were paediatric (<16 years of age) cases and 344 were in adults. Thirty-one cases were admitted to ICU/HDU.

Figure 4: FluCAN – Number of confirmed influenza hospital admissions in NSW, 03 April – 23 October, 2016.

2. Laboratory Surveillance

For the week ending 23 October 2016 the number and proportion of respiratory specimens reported by NSW sentinel laboratories [5] which tested positive for influenza A or influenza B continued to decrease and is expected to reach inter-seasonal levels over the next few weeks. The peak of activity for 2016 occurred during the week ending 4 September (Table 2).

A total of 5,800 tests for respiratory viruses were reported this week with 8.9% testing positive for influenza viruses, down from 6,342 tests and a 9.7% influenza-positive rate in the previous week. Influenza A(H3N2) is the dominant circulating influenza strain while influenza B activity remains at a low level (Figures 5 and 6).

Rhinovirus was the leading respiratory virus reported, with other viruses circulating at usual but increasing levels for this time of year (Table 2).

[5]: Preliminary laboratory data is provided by participating sentinel laboratories on a weekly basis and are subject to change. Point-of-care test results have been included since August 2012 but serological diagnoses are not included.

Preliminary laboratory data is provided by participating sentinel laboratories on a weekly basis and are subject to change. Point-of-care test results have been included since August 2012 but serological diagnoses are not included.

Participating sentinel laboratories: Pathology North (Hunter, Royal North Shore Hospital), Pathology West (Nepean, Westmead), South Eastern Area Laboratory Services, Sydney South West Pathology Service (Liverpool, Royal Prince Alfred Hospital), The Children's Hospital at Westmead, Australian Clinical Labs, Douglas Hanly Moir Pathology, Laverty Pathology, Medlab, SydPath, VDRLab to June 2016

Table 2: Summary of testing for influenza and other respiratory viruses at NSW laboratories, 1 January to 23 October 2016.

Notes: * Five-week reporting period. ** Human metapneumovirus

Figure 5: Weekly influenza positive test results by type and sub-type reported by NSW sentinel laboratories, 1 January to 23 October 2016.

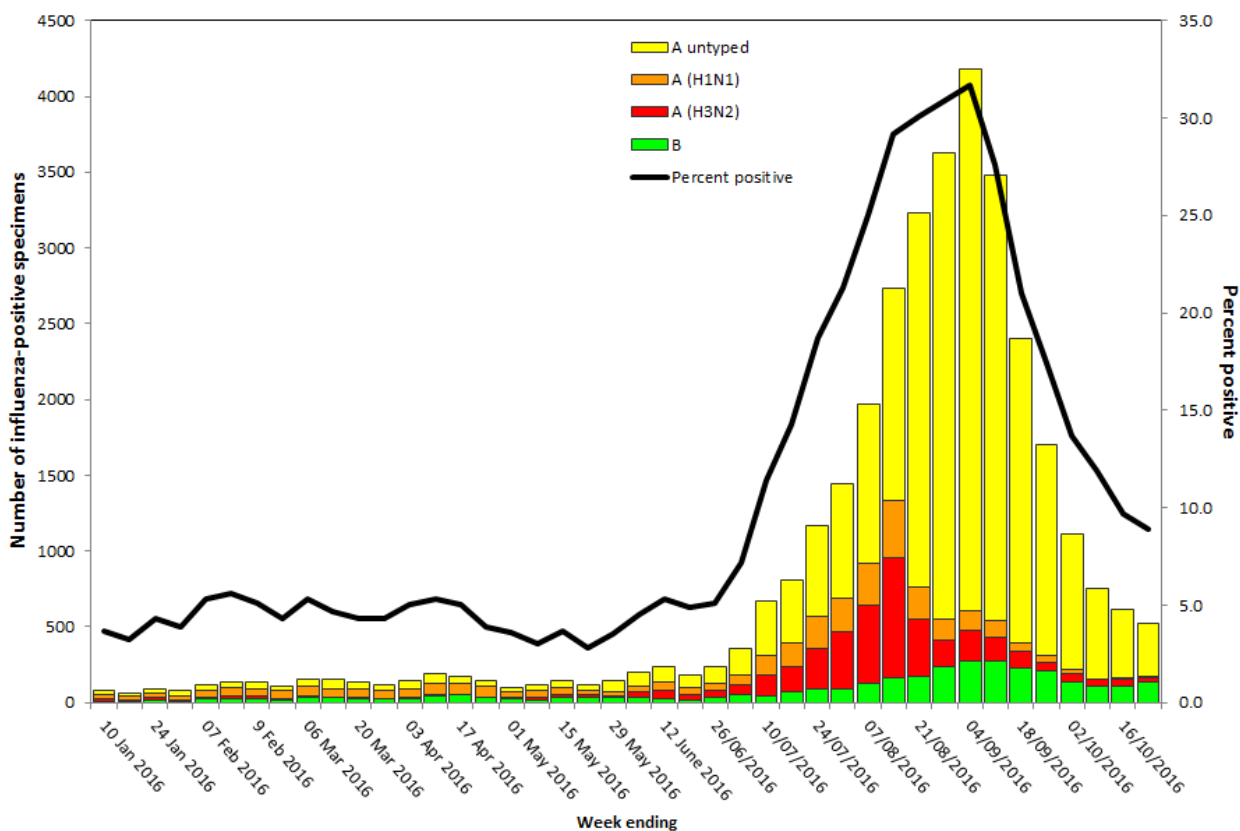

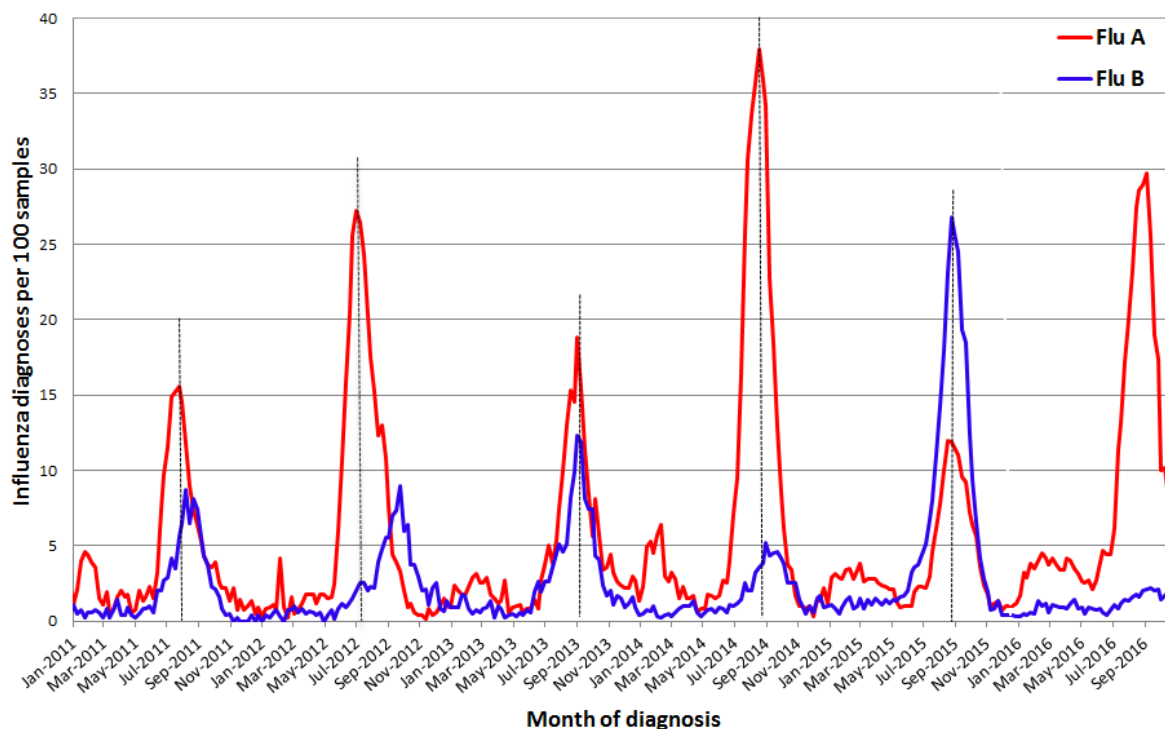

Figure 6: Percentage of laboratory tests positive for influenza A and influenza B by week, 1 January 2011 to 23 October 2016, New South Wales.

3. Community Surveillance

Influenza notifications by Local Health District (LHD)

In the week ending 23 October there were 463 notifications of influenza confirmed by polymerase chain reaction (PCR) testing, slightly higher than the 621 notifications in the previous week.

Population rates were highest in Northern NSW, Nepean Blue Mountains and Northern Sydney LHDs (Table 3). Notifications increased slightly across a few LHDs however notifications are expected to decline further over the next few weeks.

Table 3: Weekly notifications of laboratory-confirmed influenza by local health district.

Local Health District	Week ending 23 Oct 2016		Average (previous 4 weeks)	
	Number of notifications	Rate per 100 000 population	Number of notifications	Rate per 100 000 population
Central Coast	8	2.37	44	13.09
Far West	0	0	2	7.66
Hunter New England	59	6.44	143	15.55
Illawarra Shoalhaven	18	4.47	52	12.91
Mid North Coast	5	2.3	15	7.01
Murrumbidgee	18	7.54	47	19.58
Nepean Blue Mountains	31	8.27	70	18.61
Northern NSW	25	8.32	26	8.49
Northern Sydney	73	8.05	164	18.03
South Eastern Sydney	69	7.63	99	10.98
South Western Sydney	49	5.07	118	12.19
Southern NSW	5	2.4	16	7.79
Sydney	37	5.89	57	9.03
Western NSW	10	3.61	33	11.72
Western Sydney	56	5.91	153	16.13

Notes: * All data are preliminary and may change as more notifications are received. Excludes notifications based on serology.

Influenza outbreaks in institutions

There were four new respiratory outbreaks reported this week, fewer than the previous week (six). All of the outbreaks were due to influenza A and were in residential aged care facilities.

In the year to date there have been 268 laboratory confirmed influenza outbreaks in institutions reported to NSW public health units (Table 4): 254 have been due to influenza A, five were influenza B, and three were combined influenza A and B outbreaks. At least 3,974 residents were reported to have had ILI symptoms and 463 required hospitalisation. One hundred and ninety deaths in residents linked to these outbreaks have been reported, all of whom were noted to have other significant co-morbidities.

People in older age-groups are at higher risk of infection from influenza A(H3N2) strains than from the influenza A(H1N1) strain. The influenza A(H3N2) strain predominated in 2012 and 2014. In 2015, influenza B was the predominant strain, and was also the cause of some influenza outbreaks in institutions, particularly residential aged care facilities (Table 4).

Table 4: Reported influenza outbreaks in NSW institutions, 1 January 2010 to 23 October 2016.

Year	2010	2011	2012	2013	2014	2015	2016*
Number of outbreaks	2	4	39	12	120	103	268

Notes: * Year to date.

Electronic General Practice Surveillance (eGPS)

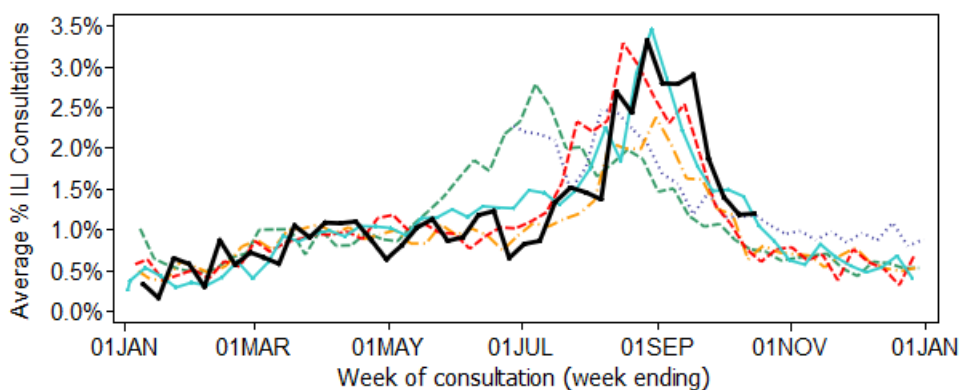

eGPS is a primary care influenza surveillance system involving sentinel general practices within three NSW Local Health Districts (LHD): Northern Sydney (NS), South Eastern Sydney (SES) and Illawarra Shoalhaven (IS). The system monitors patient consultations for influenza-like illness (ILI) as an indicator of influenza activity. Consultations for ILI are identified each week by an automatic search of electronic records for validated combinations of ILI terms rather than diagnosis codes.

Data generated from eGPS should be interpreted with caution as they are not representative of all practices within the participating LHDs or across NSW.

In Week 42:

- there were 5 surveillance reports received from eGPS sentinel practices in NSW;
- the average rate of ILI patient consultations was 1.2% (range 0.7 – 2.5%), the same as the previous week (Figure 7).

Figure 7. Average rate of influenza-like presentations to sentinel general practices by week of consultation 2011-2016 (year to date).

The Australian Sentinel Practices Research Network (ASPREN)

ASPREN is a network of sentinel general practitioners (GPs) run through the Royal Australian College of General Practitioners and the University of Adelaide which has collected de-identified information on influenza-like illness (ILI) and other conditions seen in general practice since 1991.

Participating GPs in the program report on the proportion of patients presenting with an ILI. The number of GPs participating on a weekly basis may vary.

In week 42 there were 37 ASPREN reports received from NSW GPs. The overall consultation rate for ILI was low at 1.4%, lower than the previous week (2.3%).

For further information please see the [ASPREN](#) website.

FluTracking.net

FluTracking.net is an online health surveillance system to detect epidemics of influenza.

FluTracking is a project of the University of Newcastle, the Hunter New England Local Health District and the Hunter Medical Research Institute.

Participants complete a simple online weekly survey which is used to generate data on the rate of ILI symptoms in communities.

No report this week

For further information please see the [FluTracking](#) website.

4. National and International Influenza Surveillance

National Influenza Surveillance

In the *Australian Surveillance Report No.10*, with data up to 14 October 2016, influenza activity has continued to decline following a seasonal peak in early September.

Of note:

- In the fortnight ending 14 October 2016, influenza activity decreased across most regions in the country, with the exception of the Top End of the Northern Territory where activity remained unchanged from the previous fortnight.
- National indicators of influenza-like illness (ILI) continued to decline this fortnight, with influenza remaining the primary cause of ILI presentations to sentinel general practitioners. However, influenza A and rhinovirus were the respiratory viruses most commonly detected by sentinel laboratories.
- Notifications of laboratory confirmed influenza continued to decline this fortnight but remain in the higher range of notifications reported at the same time in recent years.
- Influenza A(H3N2) continued to be the dominant circulating influenza virus nationally.
- Notification rates this year to date have been highest in adults aged 75 years or older, with a secondary, smaller peak in the very young, aged less than 5 years. This is consistent with influenza A(H3N2) infection being typically more severe in older age groups.
- Clinical severity for the season to date, as measured through the proportion of patients admitted directly to ICU and deaths attributable to pneumonia or influenza, is moderate.
- To date, the seasonal influenza vaccines appear to be a good match for circulating virus strains.

Follow the link for the [Australian Influenza Surveillance Reports](#) which provide the latest information on national influenza activity.

Global Influenza Update

The latest [WHO global update on 17 October 2016](#) provides data up to 2 October.

Influenza activity decreased in Oceania, South Africa and temperate South America. Influenza activity in the temperate zone of the northern hemisphere remained at inter-seasonal levels. Follow the link for the [WHO influenza surveillance reports](#).

Avian Influenza Update:

Human infections with avian influenza viruses

The monthly WHO risk assessment of human infections with avian and swine influenza viruses (see [Influenza at the human-animal interface](#)) was published on 3 October 2016. This report provides updated information on human cases of infection with animal influenza viruses and outbreaks among animals caused by novel influenza strains.

Of note:

- Since the previous update, new human infections with A(H5N1), A(H7N9), A(H9N2), A(H1N2)v and A(H3N2)v viruses were reported.
- The overall public health risk from currently known influenza viruses at the human-animal interface has not changed. Further human infections with viruses of animal origin can be expected, but the likelihood of sustained human-to-human transmission remains low.

Other sources of information on avian influenza and the risk of human infection include:

- US CDC [Avian influenza](#)
- European CDC (ECDC) [Avian influenza](#)
- Public Health Agency of Canada [Avian influenza H7N9](#).

5. Composition of 2017 Australian influenza vaccines

The WHO Consultation on the Composition of Influenza Vaccines for the 2017 Southern Hemisphere was held in Geneva on 26-28 September 2016.

Following the Consultation, WHO announced its recommendations for the composition of trivalent vaccine for use in the 2017 Southern Hemisphere influenza season as follows:

- an A/Michigan/45/2015 (H1N1)pdm09-like virus;
- an A/Hong Kong/4801/2014 (H3N2)-like virus;
- a B/Brisbane/60/2008-like virus (Victoria lineage)

WHO also recommended that quadrivalent vaccines containing two influenza B viruses should contain the above three viruses and a B/Phuket/3073/2013-like virus.

Of note, there has been replacement of the A/California/7/2009 (H1N1)pdm09-like virus component with an A/Michigan/45/2015 (H1N1)pdm09-like virus in the vaccine recommendations, the first time the recommended A(H1N1) strain has changed since 2010.

More details about the most recent influenza vaccine recommendations can be found at: http://www.who.int/influenza/vaccines/virus/recommendations/2017_south/en/.

The WHO consultation on the composition of influenza vaccines for the Northern Hemisphere 2016-2017 influenza season was held in February 2016. The recommended composition was unchanged from the composition recommended for the 2016 Southern Hemisphere vaccines. Information about the Northern Hemisphere vaccine recommendations can be found at: http://www.who.int/influenza/vaccines/virus/recommendations/2016_17_north/en/
