

Drug warning

Variable dose and high dose MDMA tablets/capsules

Consumption of high doses of MDMA (ecstasy) has been linked to cases of serious illness and death in New South Wales (NSW). These illnesses and deaths were a result of MDMA toxicity itself, not as a result of contaminated or fake MDMA tablets or capsules.

While consumption of one MDMA tablet/capsule alone can kill, the risk of toxicity is greatly increased if multiple MDMA tablets or capsules are consumed over a short period, or if MDMA is consumed in combination with other stimulant substances (such as methamphetamine or cocaine).

The dose of MDMA tablets and capsules recently circulating in NSW varied by up to 10 fold.¹ Higher dose MDMA tablets have also been recently identified in NSW.

The average dose in some of these tablets is **two to three times the dose**² commonly found in MDMA tablets and capsules circulating in NSW.

Consumption of MDMA may result in extremely unpleasant adverse effects, serious illness or death.

Recent higher dose tablets include light blue “LEGO” shaped tablets, and blue triangular/shield shaped tablets, stamped with a “TESLA” logo.³

Avoid consumption of these tablets.

Adverse effects may include severe agitation and paranoia, raised body temperature, seizures (fits), heart rhythm problems and death.

Seek help immediately if you, or someone you know, has consumed MDMA tablets and experiences adverse effects.

Seek help from your nearest emergency department, call Triple Zero (000) for emergency assistance, or phone the NSW Poisons Information Centre (13 11 26).

1. Of 52 MDMA seized samples analysed, dose per capsule/tablet ranged from approximately 20mg to 200mg.
2. The average dose of MDMA in the light blue “LEGO” tablets analysed was approximately 150mg, and the average dose in the blue “TESLA” tablets analysed was approximately 130mg.
3. MDMA is likely to be incompletely mixed and inconsistently distributed through these tablets. Absorption and time to peak effect may also be highly variable.
